Transition-Metal-Mediated Carbon–Fluorine Bond Formation**

Takeru Furuya, Hanns Martin Kaiser, and Tobias Ritter*

Fluorinated organic molecules have become increasingly important as pharmaceuticals^[1] and tracers for positron-emission tomography (PET), a powerful technology for non-invasive molecular imaging.^[2] The nucleus of choice for PET is fluorine-18 (¹⁸F), which is typically introduced into PET tracers through the formation of carbon–fluorine bonds using nucleophilic fluoride (¹⁸F[−]) under harsh reaction conditions.^[3] The short half-life of ¹⁸F of 109 minutes requires that carbon–fluorine bond formation occur at a late stage of the PET tracer synthesis, ideally as the last step. Many promising PET tracers for imaging are currently inaccessible due to the lack of suitable chemistry for the general, late-stage introduction of fluorine into complex, functionalized molecules.^[3, 4] Here, we present a new strategy for carbon–fluorine bond formation that relies on the fluorination of arylboronic acids via palladium complexes (eq 1). The reaction permits a general, regiospecific late-stage formation of carbon–fluorine bonds in the presence of a large variety of functional groups found in medicinally active molecules. Ultimately, we anticipate our new fluorination reaction will provide a chemical solution for the synthesis of currently inaccessible PET tracers to increase both knowledge and understanding of basic, biomedical, and pharmaceutical research through molecular imaging.^[5–8]

Carbon–fluorine bond formation is a challenging chemical transformation, and no general, functional-group-tolerant fluorination reaction of arenes is currently available for the synthesis of complex molecules. Simple fluoroarenes are typically synthesized by pyrolysis of diazonium tetrafluoroborates,^[9] direct fluorination using highly reactive elemental fluorine,^[10] or nucleophilic aromatic substitution reactions of electron-poor aromatic molecules.^[11, 12] Common aromatic organometallics, such as aryllithiums and aryl Grignard reagents can afford arylfluorides when using electrophilic

fluorine sources; however, neither aryllithiums nor aryl Grignard reagents can be used for the late-stage fluorination of arenes bearing electrophiles such as aldehydes or protic functionalities such as alcohols, limiting their general utility.^[13] Organometallics with lower basicity such as arylzinc halides, arylsilanes, arylstannanes, and arylboronic acids afford the formation of fluorobenzene in less than 10% yield (see Supporting Information). The electrophilic fluorination of specific carbon–hydrogen bonds of phenylpyridine derivatives and related structures was reported in 2006 by Sanford, and uses catalytic palladium (II) acetate and N-fluoropyridinium salts.^[14] The reaction takes advantage of a covalently attached pyridine directing group and affords fluorinated arylpyridine derivatives using microwave irradiation (100–150 °C, 1–4 h, 33–75% yield). A different approach, the reductive elimination of arylfluorides from palladium (II) fluoride complexes, would obviate the use of directing groups and has been investigated over the past decade by Grushin and Yandulov.^[15, 16] Carbon–fluorine bond formation to form aryl fluorides by reductive elimination from a Pd (II) fluoride complex has not yet been substantiated.^[16, 17] In general, all methods mentioned above cannot be employed for late-stage fluorination of structurally complex molecules due to either harsh reaction conditions or limited substrate scope.

We have sought a new regiospecific, late-stage fluorination reaction of arenes that encompasses a larger substrate scope than currently accessible, tolerates the presence of a variety of functional groups, is not limited to a particular class of arenes, and is not dependent on a directing group. Our strategy is illustrated in equation 1, and consists of the synthesis of new aryl palladium complexes that react with the electrophilic fluorination reagent SelectfluorTM^[18] to afford fluoroarenes. Our initial investigations for the design of transition-metal complexes that afford efficient fluorination was guided by the observation that palladium has been successfully employed in several carbon–heteroatom bond formations,^[19, 20] including carbon–fluorine bonds for specific substrates.^[14, 21] Additionally, the development of our methodology was directed by the necessity to predict and control the exact location of fluorination and the need to introduce fluorine at any desired aromatic position. Therefore, the target molecules for fluorination are pre-functionalized with boronic acids at the position where fluorine is desired. Boronic acids are readily accessible, compatible with a variety of functional groups present in PET tracers, competent nucleophiles for transmetalation to palladium, and can be introduced into complex molecules.^[22]

Several aryl palladium complexes based on ligands that are commonly used for palladium chemistry did not yield carbon–fluorine bond formation when evaluated for fluorination. We therefore designed new aryl palladium complexes that are derived from a bidentate nitrogenous ligand that contains a neutral and an anionic nitrogen donor atom for coordination to palladium. Our design was based on the assumptions that nitrogenous ligands resist oxidation by electrophilic fluorination reagents, can support high-valent aryl palladium fluorides for subsequent carbon–fluorine reductive elimination, and do not induce competing nitrogen–fluorine reductive elimination. We prepared the new palladium acetate complex **1** by known sulfonamide insertion^[23] into the

palladium–carbon bond of benzoquinoline-derived palladacycle **3**,^[24] followed by chloride-acetate ligand exchange (eq 2). The aryl palladium complexes **4a–m** were prepared by transmetalation using 12 different arylboronic acids (Table 1). Transmetalation proceeded at 23 °C in a basic methanol/benzene solution and afforded the palladium complexes as moisture and air stable yellow solids in 65–91% yield on a 400 mg scale after purification by chromatography on silica gel. The aryl palladium complexes derived from **1** are tolerant toward the presence of a variety of functional groups found in medicinally active compounds, including alcohols, an indole, and a primary amide. The phenyl palladium sulfonamide **4a** (R = H) crystallized in a square planar geometry with the aryl group trans to the κ^1 -sulfonamide ligand (Figure 1). The trans relationship may be crucial to prevent undesired carbon–nitrogen bond formation through reductive elimination of the aryl and sulfonamide substituents.^[25]

Figure 1. ORTEP diagrams of **1** and **4a** with thermal ellipsoids at 50% probability showing the trans relationship of the sulfonamide nitrogen atom to the acetate and aryl ligand, respectively.

Fluorination of the aryl palladium complexes **4a–m** using the electrophilic reagent Selectfluor™ (**2**) afforded the arylfluorides **5a–m** regiospecifically in 31–82% isolated yield (Table 2). Our fluorination reaction tolerates the presence of a variety of functional-groups, most notably protic functionalities that are not typically compatible with nucleophilic aromatic substitution methods due to the high basicity of fluoride ion in anhydrous solvents suitable for nucleophilic displacement.¹⁰ Additionally, electron-rich fluoroarenes (**5b**, **5g**, **5h**), which cannot be synthesized through late-stage fluorination using nucleophilic displacement, are accessible regiospecifically. The scope of the reaction was further extended to electron-poor (**5e**, **5l**), hetero (**5m**), and ortho-substituted arenes (**5k**). Fluorination proceeds in 30 minutes when performed in acetonitrile or acetone at 50 °C. While fluorination

was observed at 23 °C, the highest yields were obtained at a reaction temperature of 50 °C. Yields of isolated products were identical when the fluorination reactions were performed under rigorous exclusion of air and moisture or open to the atmosphere.

The fate of the palladium after fluorination was determined to be cationic palladium complex **6**, which was independently synthesized by treatment of palladium chloride **7** with silver tetrafluoroborate in acetonitrile (Scheme 1). Subsequent reaction of **6** with one equivalent of pyridine afforded the stable palladium tetrafluoroborate salt **8**, which was isolated and characterized. Addition of pyridine after termination of the reaction displayed in equation 4, table 2 also afforded **8**, which suggests that the pyridine-sulfonamide ligand remained coordinated to palladium throughout the reaction. The stability of the ligand-metal complex is advantageous for a prospective catalytic version of the presented fluorination reaction.

Scheme 1. Independent synthesis of palladium byproduct **6**.

Transition-metal catalysis for carbon–fluorine bond formations is a valuable goal in itself. However, for the synthesis of PET tracers, a fluorination reaction using stoichiometric amounts of transition-metal is superior to a catalytic version. Reactions stoichiometric in transition-metal are faster than the corresponding catalyzed reactions, and time is the most important factor for the efficient preparation of PET tracers due to the short half-life of ^{18}F . Moreover, price and toxicity of palladium are of lesser importance for applications in molecular imaging because PET tracers are used in picomolar quantities and are purified by HPLC before injection in vivo.

Two possible mechanisms for the presented fluorination reaction are electrophilic palladium–carbon bond cleavage and carbon–fluorine reductive elimination from a discrete, high-valent palladium fluoride.²¹ The redox activity of palladium (II) may play a crucial role for fluorination, which suggests a high-valent, discrete palladium fluoride complex as an intermediate before carbon–fluorine reductive elimination. Neither of the two mechanisms can be ruled out based on our experimental observations.

In conclusion, we report a fluorination reaction of arylboronic acids mediated by palladium, in which carbon–fluorine bond formation is the final synthetic step. The functional group tolerance, broad substrate scope, and regiospecificity of the reaction provide a general method for the late-stage fluorination of functionalized arenes. This new chemistry could be the basis for the development of a general solution for the synthesis of PET tracers for biomedical applications. Electrophilic ^{18}F sources are available, but from a biomedical perspective nucleophilic $^{18}\text{F}^-$ is the preferred source of fluorine for PET imaging because it can be prepared in high specific activity.³ A subsequent goal is therefore the development of an electrophilic fluorine source originating from nucleophilic fluoride ($^{18}\text{F}^-$). Further development of the transformation presented herein, in combination with known or new electrophilic fluorine sources, may deliver promising PET tracers to impact biomedical research in the fields of cancer, neurodegenerative diseases, gene therapy, and drug development.

Experimental Section

A representative transmetalation/fluorination sequence is described below:

Aryl palladium complex 4c: To acetato palladium complex **1** (400 mg, 0.642 mmol, 1.00 equiv) in MeOH (12 mL) and benzene (12 mL) at 23 °C is added 4-biphenyl boronic acid (140 mg, 0.706 mmol, 1.10 equiv) and K_2CO_3 (133 mg, 0.963 mmol, 1.50 equiv). The reaction mixture is stirred at 23 °C for 11 h, and the solvent is removed in vacuo. To the solid residue is added CHCl_3 (5 mL) and water (5 mL). The phases are separated and the aqueous phase is extracted with CHCl_3 (3 \times 5 mL). The combined organic phases are washed with brine (5 mL) and dried (Na_2SO_4). The filtrate is concentrated in vacuo and the residue is purified by chromatography on silica gel eluting with hexane/EtOAc 1:1 (v/v) to afford 418 mg of the title compound as a yellow solid (91% yield).

4-Fluorobiphenyl 5c: To 1-chloromethyl-4-fluoro-1,4-diazoniabicyclo-[2.2.2]octane bis(tetrafluoroborate) (**2**) (85.0 mg, 0.240 mmol, 1.20 equiv) in acetonitrile (6.0 mL) at 50 °C is added aryl palladium complex **4c** as a solid (143 mg, 0.200 mmol, 1.00 equiv) in 10 portions over 10 min. The reaction mixture is subsequently stirred at 50 °C for 20 min. After cooling to 23 °C, pyridine is added to the reaction mixture (8.1 μL , 0.10 mmol, 1.0 equiv), and the reaction mixture is filtered through a plug of celite. The filtrate is concentrated in vacuo and the residue is purified by chromatography on silica gel eluting with hexane/EtOAc 99:1 (v/v) to afford 24.8 mg of the title compound as a white solid (72% yield).

Transition-Metal-Mediated Carbon-
Fluorine Bond Formation

We report a mild, regiospecific, and functional-group-tolerant two-step fluorination reaction of arylboronic acids via novel arylpalladium complexes. The functional-group tolerance, broad substrate scope, and regiospecificity of the fluorination reaction presented herein expand the scope of other fluorination methods previously reported.

Materials and Methods

All reactions were carried out under an ambient atmosphere unless otherwise mentioned. Except as indicated otherwise, reactions were magnetically stirred and monitored by thin layer chromatography (TLC) using EMD TLC plates pre-coated with 250 μm thickness silica gel 60 F254 plates and visualized by fluorescence quenching under UV light. In addition, TLC plates were stained using ceric ammonium molybdate or potassium permanganate stain. Flash chromatography was performed on Dynamic Adsorbents Silica Gel 40–63 μm particle size using a forced flow of eluant at 0.3–0.5 bar pressure.¹ Concentration under reduced pressure was performed by rotary evaporation at 25–30 °C at appropriate pressure. Purified compounds were further dried under high vacuum (0.01–0.05 Torr). Yields refer to purified and spectroscopically pure compounds. Melting points were measured on a Büchi 510 apparatus. All melting points were measured in open capillaries and are uncorrected. NMR spectra were recorded on a Varian Unity/Inova 500 spectrometer operating at 500MHz and 125MHz for ^1H and ^{13}C acquisitions, respectively, or on a Varian Mercury 400 spectrometer operating at 375 MHz for ^{19}F acquisition. Chemical shifts (δ) of ^1H -NMR and ^{13}C -NMR spectra are reported in ppm with the solvent resonance as the internal standard. Chemical shifts (δ) of ^{19}F -NMR measurements are reported relatively to CFCl_3 as the external standard. Data is reported as follows: s = singlet, br = broad, d = doublet, t = triplet, q = quartet, m = multiplet; coupling constants in Hz; integration. High-resolution mass spectra were obtained on Jeol AX-505 or SX-102 spectrometers at the Harvard University Mass Spectrometry Facilities. THF was distilled from sodium/ benzophenone prior to use. Benzo[*h*]quinoline was purchased from TCI America. Iodobenzene diacetate, 4-nitrobenzenesulfonyl amide, phenyllithium (1.6 M in dibutylether), phenylmagnesium bromide (1.0 M in THF), 4-chlorophenylmagnesium bromide (1.0 M in Et₂O), tributylphenyltin, and N-fluorobenzene-sulfonimide were purchased from Aldrich. Palladium acetate and boronic acids were purchased from Frontier Scientific or Boron Molecular. Phenyltrimethylsilane and 1-chloromethyl-4-fluoro-1,4-diazoniabicyclo[2.2.2]octane bis(tetrafluoroborate) were purchased from VWR and used as received. Phenylzinc chloride² and potassium phenyltrifluoroborate³ were synthesized according to the literature procedures.

Experimental Data

Experimental Procedures and Compound Characterization

General procedure A for the fluorination of aryllithium, arylmagnesium, and arylzinc substrates:

Under nitrogen atmosphere, the main-group organometallic (0.0400 mmol, 1.00 equiv) is added to 1-chloromethyl-4-fluoro-1,4-diazoniabicyclo[2.2.2]octane bis(tetrafluoro-borate) (14.2 mg, 0.0400 mmol, 1.00 equiv) or N-fluorobenzenesulfoneimide (12.6 mg, 0.0400 mmol, 1.00 equiv) in THF (0.4 mL) at 23 °C. The reaction mixture is stirred at 23 °C for 12 hr and to the reaction mixture is added 3-nitrofluorobenzene (4.00 μ L, 0.0376 mmol). The yields are determined by comparing integration of the ^{19}F -NMR (375 MHz, CDCl_3 , 23 °C) resonance of fluorobenzene (−115.3 ppm) or 1-chloro-4-fluorobenzene (−116.5 ppm) and that of 3-nitrofluorobenzene (−112.0 ppm). Yields are reported in Table S1.

General procedure B for the fluorination of arysilane, arylstannate, and arylboronic acid derivatives:

To 1-chloromethyl-4-fluoro-1,4-diazoniabicyclo[2.2.2]octane bis(tetrafluoroborate) (14.2 mg, 0.0400 mmol, 1.00 equiv) in acetonitrile (0.4 mL) at 23 °C is added the main-group organometallic (0.0400 mmol, 1.00 equiv). The reaction mixture is stirred at 50 °C for 12 hr and to the reaction mixture is added 3-nitrofluorobenzene (4.00 μ L, 0.0376 mmol). The yields are determined by comparing integration of the ^{19}F -NMR (375 MHz, CDCl_3 , 23 °C) resonance of fluorobenzene (−115.3 ppm) and that of 3-nitrofluorobenzene (−112.0 ppm). Yields are reported in Table S1.

Table S1.: Direct synthesis of fluorobenzene derivatives employing electrophilic fluorine sources:

| Organometallic | Reagent | Product | Yield [%] (¹⁹ F-NMR) |
|---|--------------------------------------|---|-------------------------------------|
| PhLi | (PhSO ₂) ₂ NF | PhF ^a | 39 |
| PhMgBr | (PhSO ₂) ₂ NF | PhF ^a | 50 |

^a following general procedure A
^b following general procedure B

[{(4-Nitrophenyl)sulfonyl}imino]phenyliodinane^{4, 5}

To 4-nitrobenzenesulfonyl amide (5.00 g, 24.8 mmol, 1.00 equiv) in methanol (100 mL) at 23 °C is added potassium hydroxide (3.48 g, 62.0 mmol, 2.50 equiv). The reaction mixture is stirred at 23 °C for 10 min and cooled to 0 °C. To the reaction mixture at 0 °C is added iodobenzene diacetate (7.98 g, 24.8 mmol, 1.00 equiv). The reaction mixture is stirred at 0 °C for 10 min and further stirred at 23 °C for 2.0 h. The reaction mixture is poured onto cold water (700 mL) and kept at 0 °C for 4 h. The suspension is filtered off and the filter cake is washed with water (2 × 200 mL) and methanol (2 × 200 mL) to afford 8.39 g of the title compound as a white solid (84% yield).

¹H-NMR (500 MHz, DMSO-*d*-6, 23 °C): δ 8.02 (d, J = 9.0 Hz, 2H), 7.73 (d, J = 9.0 Hz, 2H), 7.71 (d, J = 6.5 Hz, 2H), 7.41 (t, J = 7.0 Hz, 1H), 7.26 (dd, J = 8.0 Hz, J = 7.5 Hz, 2H); ¹³C-NMR (125 MHz, DMSO-*d*-6, 23 °C): δ 151.7, 148.6, 134.4, 131.4, 130.9, 128.2, 124.3, 117.9. These spectroscopic data correspond to the

reported data in reference 5.

Benzo[*h*]quinolinyl palladium acetate dimer⁶

To benzo[*h*]quinoline (2.60 g, 14.5 mmol, 1.00 equiv) in MeOH (230 mL) at 23 °C is added palladium acetate (3.26 g, 14.5 mmol, 1.00 equiv). After stirring for 3.0 h, the suspension is filtered off and the filter cake is washed with MeOH (100 mL) and Et₂O (100 mL) to afford 4.27 g of the title compound as a yellow solid (86% yield).

¹H-NMR (500 MHz, CDCl₃, 23 °C): δ 7.80 (dd, J = 5.5 Hz, 1.5 Hz, 1H), 7.43 (dd, J = 8.0 Hz, J = 1.5 Hz, 1H), 7.24–7.18 (m, 3H), 7.08 (dd, J = 7.0 Hz, J = 1.5 Hz, 1H), 6.97 (d, J = 9.0 Hz, 1H), 6.46 (dd, J = 7.5 Hz, 5.0 Hz, 1H), 2.38 (s, 3H); ¹³C-NMR (125 MHz, CDCl₃, 23 °C): δ 182.5, 153.2, 148.9, 148.8, 140.0, 135.3, 132.4, 129.0, 127.9, 127.7, 125.0, 122.9, 122.1, 119.8, 25.2. These spectroscopic data correspond to the reported data in reference 6.

Benzo[*h*]quinolinyl palladium chloro dimer⁷

To benzo[*h*]quinolinyl palladium acetate dimer (4.27 g, 12.4 mmol, 1.00 equiv) in EtOH (100 mL) at 0 °C is added lithium chloride (10.5 g, 24.8 mmol, 20.0 equiv). The reaction mixture is warmed to 23 °C and stirred for 1.0 h. The reaction mixture is filtered off and the filter cake is washed with water (3 \times 100 mL), MeOH (2 \times 100 mL), and Et₂O (100 mL) to afford 3.89 g of the title compound as a pale yellow solid (98% yield).

¹H-NMR (500 MHz, DMSO-*d*-6, 23 °C): δ 9.44 (d, J = 4.5 Hz, 1.0 Hz, 1H), 8.72 (br), 8.67 (d, J = 7.5 Hz, 1H), 8.61 (br), 8.22 (d, J = 7.0 Hz, 1H), 7.91 (d, J = 9.0 Hz, 1H), 7.86–7.74 (m, 3H), 7.73 (br), 7.60 (br), 7.53

⁷ Hartwell, G. E., Lawrence, R. W. & Smas, M. J. The formation of palladium(II)– and platinum(II)–carbon bonds by proton abstraction from benzo[*h*]quinoline and 8-methylquinoline. *J. Chem. Soc. D.: Chem. Commun.* 912 (1970).

(dd, $J = 7.5$ Hz, $J = 7.0$ Hz 1H), 7.38 (br); ^{13}C -NMR (125 MHz, $\text{DMSO-}d_6$, 23 °C): δ 153.9, 152.2, 150.7, 150.6, 148.0, 141.7, 139.9, 134.4, 130.8, 129.6, 129.4, 127.5, 125.1, 124.4, 123.0, 122.9. Note: The complicated ^1H and ^{13}C -NMR spectra are probably due to the mixture of the title compound and solvent adduct in $\text{DMSO-}d_6$. The title compound is not soluble in non-coordinating solvents.

Chloro palladium complex **7**⁸

To chloropalladium dimer **3** (1.60 g, 5.00 mmol, 1.00 equiv) in THF (75.0 mL) at 23 °C is added pyridine (3.20 mL, 40.0 mmol, 8.00 equiv) and $\text{PhI}=\text{N-}p\text{-Ns}$ (3.00 g, 7.50 mmol, 1.50 equiv). The reaction mixture is stirred at 23 °C for 17 h. The reaction mixture is filtered off and the filter cake is washed with Et_2O (2×10 mL) to afford 2.40 g of the title compound as a light brown solid (78% yield).

^1H -NMR (500 MHz, CDCl_3 , 23 °C): δ 9.20 (dd, $J = 4.5$ Hz, 1.0 Hz, 1H), 8.97 (d, $J = 4.5$ Hz, 2H), 8.07 (dd, $J = 6.5$ Hz, 1.0 Hz, 1H), 7.92–7.82 (m, 5H), 7.53–7.45 (m, 5H), 7.39 (dd, $J = 6.5$ Hz, 4.5 Hz, 1H), 7.32 (d, $J = 6.0$ Hz, 2H); ^{13}C -NMR (125 MHz, CDCl_3 , 23 °C): δ 154.1, 152.5, 148.3, 147.3, 141.6, 138.9, 137.8, 137.7, 136.1, 130.7, 130.1, 128.3, 127.1, 126.9, 126.8, 126.2, 125.3, 124.5, 122.5, 122.3. These spectroscopic data correspond to the reported data in reference 6.

Acetato palladium complex **1**

To chloro palladium complex **7** (2.22 g, 3.70 mmol, 1.00 equiv) in CH_2Cl_2 (74.0 mL) at 23 °C is added AgOAc (3.09 g, 18.5 mmol, 5.00 equiv). The suspension is stirred at 40 °C for 2.0 h. After cooling to 23 °C, the suspension is filtered through a plug of celite. The filtrate is concentrated in vacuo and the residue is

Aryl palladium complex **4g**

To acetato palladium complex **1** (400 mg, 0.642 mmol, 1.00 equiv) in MeOH (12.8 mL) and benzene (12.8 mL) at 23 °C is added 4-hydroxyphenylboronic acid (97 mg, 0.706 mmol, 1.10 equiv) and K₂CO₃ (133 mg, 0.963 mmol, 1.50 equiv). The reaction mixture is stirred at 23 °C for 15 h, and the solvent is removed in vacuo. To the solid residue is added CHCl₃ (5 mL) and water (5 mL). The phases are separated and the aqueous phase is extracted with CHCl₃ (3 × 5 mL). The combined organic phases are washed with brine (5 mL) and dried (Na₂SO₄). The filtrate is concentrated in vacuo and the residue is purified by chromatography on silica gel eluting with hexane/EtOAc 2:3 (v/v) to afford 295 mg of the title compound as a yellow solid (70% yield).

TLC (hexane/EtOAc, 1:1 v/v): *R*_F = 0.17; m.p.: 174 °C (decomp.); ¹H-NMR (500 MHz, CDCl₃, 23 °C): δ 8.99 (d, *J* = 6.5 Hz, 2H), 8.27 (dd, *J* = 5.0 Hz, 1.5 Hz, 1H), 7.94 (dd, *J* = 7.5 Hz, 1.5 Hz, 1H), 7.79–7.68 (m, 5H), 7.47 (d, *J* = 9.0 Hz, 2H), 7.40–7.27 (m, 5H), 7.04 (dd, *J* = 7.5 Hz, 5.5 Hz, 1H), 6.60 (d, *J* = 8.0 Hz, 2H), 6.38 (d, *J* = 8.0 Hz, 2H), 4.40 (s, 1H); ¹³C-NMR (125 MHz, CDCl₃, 23 °C): δ 154.1, 153.4, 152.7, 149.2, 147.8, 147.4, 144.6, 143.4, 142.2, 137.9, 136.4, 134.8, 130.5, 130.1, 128.5, 127.5, 127.0, 126.8, 125.1, 124.7, 124.3, 122.4, 121.4, 114.5; HRMS-FIA (*m/z*): [M + H]⁺ calcd for C₃₀H₂₂N₄O₅PdS, 657.0419; found, 657.0433. Anal: calcd for C₃₀H₂₂N₄O₅PdS: C, 54.84; H, 3.38; N, 8.53; found: C, 54.56; H, 3.53; N, 8.26.

Aryl palladium complex 4h

To acetato palladium complex **1** (400 mg, 0.642 mmol, 1.00 equiv) in MeOH (12.8 mL) and benzene (12.8 mL) at 23 °C is added 4-methoxyphenylboronic acid (107 mg, 0.706 mmol, 1.10 equiv) and K₂CO₃ (133 mg, 0.963 mmol, 1.50 equiv). The reaction mixture is stirred at 23 °C for 3.0 h, and the solvent is removed in vacuo. To the solid residue is added CHCl₃ (5 mL) and water (5 mL). The phases are separated and the aqueous phase is extracted with CHCl₃ (3 × 5 mL). The combined organic phases are washed with brine (5 mL) and dried (Na₂SO₄). The filtrate is concentrated in vacuo and the residue is purified by chromatography on silica gel eluting with hexane/EtOAc 1:1 (v/v) to afford 340 mg of the title compound as a yellow solid (79% yield).

TLC (hexane/EtOAc 1:1, v/v): *R*_F = 0.29; m.p.: 154 °C (decomp.); ¹H-NMR (500 MHz, CDCl₃, 23 °C): δ 8.99 (d, *J* = 5.5 Hz, 2H), 8.27 (d, *J* = 5.5 Hz, 1H), 7.94 (dd, *J* = 8.0 Hz, 1.5 Hz, 1H), 7.80–7.68 (m, 5H), 7.47 (d, *J* = 6.0 Hz, 2H), 7.38 (d, *J* = 8.5 Hz, 1H), 7.35–7.28 (m, 4H), 7.04 (dd, *J* = 8.0 Hz, 5.5 Hz, 1H), 6.64 (d, *J* = 8.0 Hz, 2H), 6.44 (d, *J* = 8.0 Hz, 2H), 3.65 (s, 3H); ¹³C-NMR (125 MHz, CDCl₃, 23 °C): δ 156.9, 154.1, 153.5,

Fluorobenzene 5a

To 1-chloromethyl-4-fluoro-1,4-diazoniabicyclo[2.2.2]octane bis(tetrafluoroborate) (**2**), (4.3 mg, 0.012 mmol, 1.2 equiv) in acetonitrile- d_3 (0.3 mL) at 50 °C is added aryl palladium complex **4a** (6.4 mg, 0.010 mmol, 1.0 equiv) as a solid in 10 portions over 10 min. The reaction mixture is stirred at 50 °C for 20 min. The reaction mixture is cooled to 23 °C, and the yield is determined by comparing integration of the $^{19}\text{F-NMR}$ (375 MHz, acetonitrile- d_3 , 23 °C) resonance of fluorobenzene (–115.3 ppm) and that of 3-nitrofluorobenzene (–112.0 ppm, 2.00 μL , 0.0188 mmol). (81% yield). The $^{19}\text{F-NMR}$ chemical shift of the product corresponds to that of authentic sample purchased from Aldrich.

1-*tert*-Butyl-4-fluorobenzene 5b

To 1-chloromethyl-4-fluoro-1,4-diazoniabicyclo[2.2.2]octane bis(tetrafluoroborate) (**2**) (4.3 mg, 0.012 mmol, 1.2 equiv) in acetonitrile- d_3 (0.3 mL) at 50 °C is added aryl palladium complex **4b** (7.0 mg, 0.010 mmol, 1.0

equiv) as a solid in 10 portions over 10 min. The reaction mixture is stirred at 50 °C for 20 min. The reaction mixture is cooled to 23 °C, and the yield is determined by comparing integration of the ^{19}F -NMR (375 MHz, acetonitrile- d_3 , 23 °C) resonance of 1-*tert*-butyl-4-fluorobenzene (−120.7 ppm) and that of 3-nitrofluorobenzene (−112.0 ppm, 2.00 μL , 0.0188 mmol). (79% yield). The ^{19}F -NMR chemical shift of the product corresponds to that of reported data.⁹

4-Fluorobiphenyl 5c

To 1-Chloromethyl-4-fluoro-1,4-diazoniabicyclo[2.2.2]octane bis(tetrafluoroborate) (**2**) (85.0 mg, 0.240 mmol, 1.20 equiv) in acetonitrile (6.0 mL) at 50 °C is added aryl palladium complex **4c** (143 mg, 0.200 mmol, 1.00 equiv) as a solid in 10 portions over 10 min. The reaction mixture is stirred at 50 °C for 20 min. After cooled to 23 °C, to the reaction mixture is added pyridine (8.1 μL , 0.10 mmol, 1.0 equiv), and filtered through a plug of celite. The filtrate is concentrated in vacuo and the residue is purified by chromatography on silica gel eluting with hexane/EtOAc 99:1 (v/v) to afford 24.8 mg of the title compound as a white solid (72% yield). TLC (hexane/EtOAc, 19:1 v/v): R_F = 0.60; ^1H -NMR (500 MHz, CDCl_3 , 23 °C): δ 7.60–7.54 (m, 4H), 7.47 (dd, J = 7.5 Hz, 7.0 Hz, 2H), 7.36 (t, J = 7.5 Hz, 1H), 7.14 (dd, J = 8.0 Hz, 7.5 Hz, 2H); ^{13}C -NMR (125 MHz, CDCl_3 , 23 °C): δ 162.7 (d, J = 244 Hz), 140.5, 137.6, 129.0, 128.9 (d, J = 8.5 Hz), 127.5, 127.3, 115.8 (d, J = 21 Hz); ^{19}F -NMR (375 MHz, CDCl_3 , 23 °C): δ −116.2. These spectroscopic data correspond to those of authentic sample purchased from Alfa Aesar.

⁹ Laali, K. K., Okazaki, T. Bunge, S. D. *N*-(Trifluoromethylsulfonyl)aryloxytrifluoromethylsulfoximines [ArO-SO(CF₃)=NTf] and *N*-aryltriflimides Ar-N(Tf)₂ by thermal and photolytic dediazonation of [ArN₂][BF₄] in [BMIM][Tf₂N] ionic liquid: exploiting the ambident nucleophilic character of a "nonnucleophilic" anion. *J. 4-Fluorobenzylalcohol 5d

To 1-Chloromethyl-4-fluoro-1,4-diazoniabicyclo[2.2.2]octane bis(tetrafluoroborate) (**2**) (42.5 mg, 0.120 mmol, 1.20 equiv) in acetonitrile (3.0 mL) at 50 °C is added aryl palladium complex **4d** (67.1 mg, 0.100 mmol, 1.00 equiv) as a solid in 10 portions over 10 min. The reaction mixture is stirred at 50 °C for 20 min. After cooled to 23 °C, to the reaction mixture is added pyridine (8.1 μ L, 0.10 mmol, 1.0 equiv). After concentrated in vacuo, the residue is purified by preparative TLC eluting with pentane/Et₂O 7:3 (v/v) to afford 8.8 mg of the title compound as colorless oil (70% yield).

TLC (hexane/EtOAc 7:3 v/v): R_F = 0.61; ¹H-NMR (500 MHz, CDCl₃, 23 °C): δ 7.29–7.25 (m, 2H), 7.05–7.00 (dd, J = 8.0 Hz, 7.5 Hz, 2H), 4.55 (s, 2H), 3.10 (br, 1H); ¹³C-NMR (125 MHz, CDCl₃, 23 °C): δ 162.5 (d, J = 243 Hz), 136.8, 129.0 (d, J = 8.3 Hz), 115.6 (d, J = 21 Hz), 64.5; ¹⁹F-NMR (375 MHz, CDCl₃, 23 °C): δ –115.4. These spectroscopic data correspond to those of authentic sample purchased from Alfa Aesar.

4-Fluorobenzaldehyde 5e

To 1-Chloromethyl-4-fluoro-1,4-diazoniabicyclo[2.2.2]octane bis(tetrafluoroborate) (**2**) (42.5 mg, 0.120 mmol, 1.20 equiv) in acetonitrile (3.0 mL) at 50 °C is added aryl palladium complex **4e** (66.9 mg, 0.100 mmol, 1.00 equiv) as a solid in 10 portions over 10 min. The reaction mixture is stirred at 50 °C for 20 min. After cooled to 23 °C, to the reaction mixture is added pyridine (8.1 μ L, 0.10 mmol, 1.0 equiv). After concentrated in vacuo, the residue is purified by preparative TLC eluting with pentane/Et₂O 7:3 (v/v) to afford 8.8 mg of the title compound as colorless oil (61% yield).

TLC (hexane/EtOAc, 7:3 v/v): R_F = 0.77; ¹H-NMR (500 MHz, CDCl₃, 23 °C): δ 9.95 (s, 1H), 7.92–7.88 (m,

2H), 7.22–7.18 (dd, $J = 8.0$ Hz, 7.5 Hz, 2H); ^{13}C -NMR (125 MHz, CDCl_3 , 23 °C): δ 190.7, 166.7 (d, $J = 255$ Hz), 133.2, 132.5 (d, $J = 9.9$ Hz), 116.6 (d, $J = 22$ Hz); ^{19}F -NMR (375 MHz, CDCl_3 , 23 °C): δ -102.9. These spectroscopic data correspond to those of authentic sample purchased from Aldrich.

4-Fluorobenzamide 5f

To 1-Chloromethyl-4-fluoro-1,4-diazoniabicyclo[2.2.2]octane bis(tetrafluoroborate) (**2**) (42.5 mg, 0.120 mmol, 1.20 equiv) in acetonitrile (3.0 mL) at 50 °C is added aryl palladium complex **4f** (68.4 mg, 0.100 mmol, 1.00 equiv) as a solid in 10 portions over 10 min. The reaction mixture is stirred at 50 °C for 20 min. After cooled to 23 °C, to the reaction mixture is added pyridine (8.1 μL , 0.10 mmol, 1.0 equiv). After concentrated in vacuo, the residue is purified by preparative TLC eluting with EtOAc to afford 10.3 mg of the title compound as colorless oil (74% yield).

TLC (EtOAc): $R_F = 0.40$; ^1H -NMR (500 MHz, $\text{DMSO}-d_6$, 23 °C): δ 8.02 (br, 1H), 7.95 (dd, $J = 9.0$ Hz, 6.0 Hz, 2H), 7.42 (br, 1H), 7.26 (dd, $J = 7.5$ Hz, 7.0 Hz, 2H); ^{13}C -NMR (125 MHz, $\text{DMSO}-d_6$, 23 °C): δ 167.6, 164.6 (d, $J = 247$ Hz), 131.4, 130.8 (d, $J = 14$ Hz), 115.8 (d, $J = 21$ Hz); ^{19}F -NMR (375 MHz, $\text{DMSO}-d_6$, 23 °C): δ -110.0. These spectroscopic data correspond to those of authentic sample purchased from Alfa Aesar.

4-Fluorophenol 5g

To 1-Chloromethyl-4-fluoro-1,4-diazoniabicyclo[2.2.2]octane bis(tetrafluoroborate) (**2**) (85.0 mg, 0.240 mmol, 1.20 equiv) in acetone (6.0 mL) at 50 °C is added aryl palladium complex **4g** (131 mg, 0.200 mmol,

1.00 equiv) as a solid in 10 portions over 10 min. The reaction mixture is stirred at 50 °C for 20 min. After cooled to 23 °C, to the reaction mixture is added pyridine (16 μ L, 0.20 mmol, 1.0 equiv). After concentrated in vacuo, the residue is purified by preparative TLC eluting with Hexane/EtOAc 7:3 (v/v) to afford 6.9 mg of the title compound as a white solid (31% yield).

TLC (hexane/EtOAc, 7:3 v/v): R_F = 0.58; $^1\text{H-NMR}$ (500 MHz, CDCl_3 , 23 °C): δ 6.95–6.95 (dd, J = 8.0 Hz, 7.5 Hz, 2H), 6.80–6.76 (m, 2H), 5.41 (s, 1H); $^{13}\text{C-NMR}$ (125 MHz, CDCl_3 , 23 °C): δ 157.6 (d, J = 237 Hz), 151.5, 116.5 (d, J = 8.0 Hz), 116.3 (d, J = 21 Hz); $^{19}\text{F-NMR}$ (375 MHz, CDCl_3 , 23 °C): δ –124.3. These spectroscopic data correspond to those of authentic sample purchased from Aldrich.

4-Fluoroanisole 5h

To 1-Chloromethyl-4-fluoro-1,4-diazoniabicyclo[2.2.2]octane bis(tetrafluoroborate) (**2**) (85.0 mg, 0.240 mmol, 1.20 equiv) in acetone (6.0 mL) at 50 °C is added aryl palladium complex **4h** (134 mg, 0.200 mmol, 1.00 equiv) as a solid in 10 portions over 10 min. The reaction mixture is stirred at 50 °C for 20 min. After cooled to 23 °C, to the reaction mixture is added pyridine (16 μ L, 0.20 mmol, 1.0 equiv). After concentrated in vacuo, the residue is purified by preparative TLC eluting with pentane/Et₂O 9:1 (v/v) to afford 11.6 mg of the title compound as colorless oil (46% yield).

TLC (hexane/EtOAc, 9:1 v/v): R_F = 0.55; $^1\text{H-NMR}$ (500 MHz, CDCl_3 , 23 °C): δ 7.01–6.95 (m, 2H), 6.87–6.81 (m, 2H), 3.79 (s, 3H); $^{13}\text{C-NMR}$ (125 MHz, CDCl_3 , 23 °C): δ 157.4 (d, J = 247 Hz), 155.9, 116.0 (d, J = 23 Hz), 115.0 (d, J = 7.7 Hz), 56.0; $^{19}\text{F-NMR}$ (375 MHz, CDCl_3 , 23 °C): δ –124.8. These spectroscopic data correspond to those of authentic sample purchased from Alfa Aesar.

1-Bromo-4-fluorobenzene 5i

To 1-Chloromethyl-4-fluoro-1,4-diazoniabicyclo[2.2.2]octane bis(tetrafluoroborate) (**2**) (42.5 mg, 0.120 mmol, 1.20 equiv) in acetonitrile (3.0 mL) at 50 °C is added aryl palladium complex **4i** (72.0 mg, 0.100 mmol, 1.00 equiv) as a solid in 10 portions over 10 min. The reaction mixture is stirred at 50 °C for 20 min. After cooled to 23 °C, to the reaction mixture is added pyridine (8.1 μ L, 0.10 mmol, 1.0 equiv). After concentrated in vacuo, the residue is purified by preparative TLC eluting with pentane/Et₂O 19:1 (v/v) to afford 12.8 mg of the title compound as colorless oil (73% yield).

TLC (hexane/EtOAc, 19:1 v/v): R_F = 0.70; ¹H-NMR (500 MHz, CDCl₃, 23 °C): δ 7.47–7.42 (m, 2H), 6.98–6.92 (m, 2H); ¹³C-NMR (125 MHz, CDCl₃, 23 °C): δ 162.1 (d, J = 245 Hz), 133.2, (d, J = 8.5 Hz), 117.5 (d, J = 23 Hz), 116.8; ¹⁹F-NMR (375 MHz, CDCl₃, 23 °C): δ –115.7. These spectroscopic data correspond to those of authentic sample purchased from Alfa Aesar.

4-Chloro-2-fluorotoluene 5k

To 1-Chloromethyl-4-fluoro-1,4-diazoniabicyclo[2.2.2]octane bis(tetrafluoroborate) (**2**) (42.5 mg, 0.120 mmol, 1.20 equiv) in acetonitrile (3.0 mL) at 50 °C is added aryl palladium complex **4k** (68.9 mg, 0.100 mmol, 1.00 equiv) as a solid in 10 portions over 10 min. The reaction mixture is stirred at 50 °C for 20 min. After cooled to 23 °C, to the reaction mixture is added pyridine (8.1 μ L, 0.10 mmol, 1.0 equiv). After concentrated in vacuo, the residue is purified by preparative TLC eluting with pentane/Et₂O 9:1 (v/v) to afford 11.9 mg of the title compound as colorless oil (82% yield).

TLC (hexane/EtOAc, 9:1 v/v): R_F = 0.72; ¹H-NMR (500 MHz, CDCl₃, 23 °C): δ 7.13–7.08 (dd, J = 7.5 Hz, 7.0 Hz, 2H), 7.05–7.01 (m, 2H); ¹³C-NMR (125 MHz, CDCl₃, 23 °C): δ 161.3 (d, J = 246 Hz), 132.3, 132.2 (d,

$J = 5.9$ Hz), 124.3, 123.6 (d, $J = 17$ Hz), 116.0 (d, $J = 26$ Hz), 14.4; ^{19}F -NMR (375 MHz, CDCl_3 , 23 °C): δ –115.1; These spectroscopic data correspond to those of authentic sample purchased from Alfa Aesar.

4-Fluorobenzotrifluoride **5l**

To 1-chloromethyl-4-fluoro-1,4-diazoniabicyclo[2.2.2]octane bis(tetrafluoroborate) (**2**) (4.3 mg, 0.012 mmol, 1.2 equiv) in acetonitrile- d_3 (0.3 mL) at 50 °C is added aryl palladium complex **4l** (6.4 mg, 0.010 mmol, 1.0 equiv) as a solid in 10 portions over 10 min. The reaction mixture is stirred at 50 °C for 20 min. The reaction mixture is cooled to 23 °C, and the yield is determined by comparing integration of the ^{19}F -NMR (375 MHz, acetonitrile- d_3 , 23 °C) resonance of 4-fluorobenzotrifluoride (–109.4 ppm) and that of 3-nitrofluorobenzene (–112.0 ppm, 2.00 μL , 0.0188 mmol). (54% yield). The ^{19}F -NMR chemical shift of the product corresponds to that of authentic sample purchased from Alfa Aesar.

N-Boc-5-fluoroindole **5m**

To 1-Chloromethyl-4-fluoro-1,4-diazoniabicyclo[2.2.2]octane bis(tetrafluoroborate) (**2**) (42.5 mg, 0.120 mmol, 1.20 equiv) in acetone (3.0 mL) at 50 °C is added aryl palladium complex **4m** (78.0 mg, 0.100 mmol, 1.00 equiv) as a solid in 10 portions over 10 min. The reaction mixture is stirred at 50 °C for 20 min. After cooled to 23 °C, to the reaction mixture is added pyridine (8.1 μL , 0.10 mmol, 1.0 equiv). After concentrated in vacuo, the residue is purified by preparative TLC eluting with hexane/EtOAc 7:3 (v/v) to afford 14.1 mg of the title compound as colorless oil (60% yield).

TLC (hexane/EtOAc 7:3 v/v): $R_F = 0.753$; ^1H -NMR (500 MHz, CDCl_3 , 23 °C): δ 8.08 (br, 1H), 7.62 (d, $J =$

4.0 Hz, 1H), 7.20 (dd, $J = 6.5$ Hz, $J = 2.0$ Hz, 1H), 7.03 (ddd, $J = 7.0$ Hz, 6.5 Hz, 2.0 Hz, 1H), 6.52 (d, $J = 4.0$ Hz, 1H), 1.68 (s, 9H); ^{13}C -NMR (125 MHz, CDCl_3 , 23 °C): δ 159.5 (d, $J = 238$ Hz), 149.7, 131.8, 131.6 (d, $J = 10$ Hz), 127.7, 116.3 (d, $J = 9.1$ Hz), 112.2 (d, $J = 24$ Hz), 107.2, 106.5 (d, $J = 24$ Hz), 84.1, 28.4; ^{19}F -NMR (375 MHz, CDCl_3 , 23 °C): δ -121.7. These spectroscopic data correspond to those of authentic sample independently synthesized from 5-fluoroinodole and Boc_2O .

Bispyridine palladium tetrafluoroborate salt **8**

To chloro palladium complex **7** (59.9 mg, 0.100 mmol, 1.00 equiv) in acetonitrile (1.0mL) at 23 °C is added AgBF_4 (38.8 mg, 0.200 mmol, 2.00 equiv). The suspension is stirred at 23 °C for 1.0 hour and to the suspension is added pyridine (8.1 μL , 0.10 mmol, 1.0 equiv). The suspension is filtered through a plug of celite and the filtrate is concentrated in vacuo to afford 67.9 mg of the title compound as an orange solid (67.9 mg, 93% yield).

^1H -NMR (500 MHz, acetone- d_6 , 23 °C): δ 9.29 (d, $J = 5.5$ Hz, 2H), 8.99 (d, $J = 5.5$ Hz, 2H), 8.51 (dd, $J = 5.5$ Hz, 1.5 Hz, 1H), 8.44 (dd, $J = 7.5$ Hz, 1.0 Hz, 1H), 8.15–8.08 (m, 3H), 8.01 (dd, $J = 8.0$ Hz, 7.5 Hz, 1H), 7.89 (t, $J = 7.5$ Hz, 1H), 7.80–7.70 (m, 4H), 7.66 (d, $J = 9.0$ Hz, 2H), 7.59–7.52 (m, 4H), 7.48 (dd, $J = 8.0$ Hz, 5.5 Hz, 1H); ^{13}C -NMR (125 MHz, CDCl_3 , 23 °C): δ 152.6, 152.4, 152.3, 152.2, 152.9, 152.8, 148.7, 147.2, 141.4, 140.8, 140.7, 140.6, 140.5, 140.3, 140.2, 137.7, 136.5, 130.8, 130.6, 130.3, 129.2, 128.8, 127.9, 127.8, 127.4, 127.2, 126.9, 126.8, 126.7, 126.5, 125.2, 124.9, 123.9, 123.8, 123.1, 122.9, 118.4. The complex ^{13}C spectrum is presumably due to pyridine exchange with the NMR solvent acetone. ^{19}F -NMR (375 MHz, acetone- d_6 , 23 °C): δ -151.5; HRMS-FIA (m/z): $[\text{M} - \text{C}_5\text{H}_5\text{N} + \text{C}_2\text{H}_3\text{N} - \text{BF}_4]^+$ calcd for $\text{C}_{31}\text{H}_{24}\text{N}_4\text{O}_5\text{PdS}$, 604.0265; found, 604.0228.

Figure S1.: acetato palladium complex 1 (CCDC 67599)

The x-ray structure of acetato palladium complex **1** with hydrogens and with the atom labeling scheme employed. The nonhydrogen atoms are depicted with 50% probability ellipsoids.
